

withheld

1) Check for certain sequence in any file in any dir

```
d = "C:\Users\NewFolder"
```

```
for files = readFolder(d)
```

```
for i in d: search = "ERROR"
```

```
for i in range(len(d)):
```

```
    u = readLine(d[i])
```

```
    for j in range(len(u)):
```

```
        if search in j:
```

```
            print(j, u, i, d[i])
```

This prints the error, line of error and which log the error is located in.

2) Memory usage

```
import os
```

```
import psutil
```

```
log = psutil.Processes()
```

```
for i in log:
```

```
    print(i, i.memory_usage, i.cpu_usage, i.name)
```

This prints each task, its memory usage & its cpu utilization.

3) shell script for CPU Health

threshold = 80

timestamp = "+%Y-%m-%d_%H-%m-%S"

memory = (\$usage)

echo >> "{ \$usage } is usage"

echo >> "Threshold is met by { \$process }"

This alerts if any process meets its threshold limit of memory utilization with the time stamp

4) List process based of Resource Utilization

import plot

tasks = plt. resources

task = sorted(~~task~~, memory-utilization)

This sorts from least utilized resource to most utilizing resource

task = sorted(task, memory-util-, reverse=True)

High utilized task ~~to~~ will be shown.
